

What is claimed is:

1. A method for automated form completion for a user of a computer, the method comprising the steps of:

5 identifying one or more fields in a form; and  
automatically supplying information corresponding to the one or more identified fields without intervention by the user.

2. The method of claim 1, further comprising the steps of:

10 determining the correct spelling of one or more words associated with the one or more fields; and  
determining a synonym for one or more words associated with the one or more fields.

3. The method of claim 2, further comprising the step of:

15 determining the identity of the one or more fields based on the respective similarity of each field to a previously stored field.

4. The method of claim 3, wherein the form is a Web page and the method further comprises:

20 reading a source code of the Web page; and  
determining fields based on associated mark-up tags.

5. The method of claim 3, wherein the form is a Web page and the method further comprises:

25 capturing an image of the Web page;  
identifying text by performing OCR on the image;  
identifying field entry box(es) by performing edge analyses on the image; and  
determining coordinates of the identified fields entry box(es).

6. The method of claim 1, further comprising the step of:  
prompting the user to accept the automatically supplied information.

7. The method of claim 1, further comprising the step of:  
5 enabling the user to enter information for fields unidentified in the form.

8. A computer readable medium on which is embedded computer software capable of  
automatically completing a form for a user of a computer, the software comprising:  
identifying one or more fields in the form; and  
10 automatically supplying information corresponding to the one or more identified fields  
without intervention by the user.

9. The computer readable medium of claim 8, further comprising the step of:  
determining the correct spelling of one or more words associated with the one or more  
15 fields; and  
determining a synonym for one or more words associated with the one or more fields.

10. The computer readable medium of claim 9, further comprising the step of:  
determining the identity of the one or more fields based on the respective similarity of  
20 each field to a previously stored field.

11. The computer readable medium of claim 10, wherein the form is a Web page and the  
method further comprises:  
reading a source code of the Web page; and  
25 determining fields based on associated mark-up tags.

12. The computer readable medium of claim 10, wherein the form is a Web page and the method further comprises:

capturing an image of the Web page;

identifying text by performing OCR on the image;

identifying field entry box(es) by performing edge analyses on the image; and

determining coordinates of the identified fields entry box(es).

13. The computer readable medium of claim 8, further comprising the step of:  
prompting the user to accept the automatically supplied information.

14. The computer readable medium of claim 8, further comprising the step of:  
enabling the user to enter information for fields unidentified in the form.

15. A system for automated form completion for a user of a computer comprising:  
a field identifier module capable of identifying one or more fields in a form; and  
a field completer module capable of supplying information corresponding to the one  
or more identified fields without intervention by the user.

16. The system of claim 15, wherein the field identifier module comprises:  
a parser configured to generate a table of fields;  
a spell checker configured to store alternative spellings of fields;  
a thesaurus configured to store synonyms of fields; and  
a comparison algorithm connected to the parser, the spell checker and the thesaurus,  
the comparison algorithm configured to determine the identity of each field based on the  
respective similarity of each field to one or more fields in the database.

17. The system of claim 16, further comprising:  
a data collector module configured to read the form; and  
an information checker comprising:  
a user interface configured to display an unidentified field and user selectable  
options to the user;  
associated logic configured to determine the identity of the unidentified field  
in response to a selection; and  
the information checker is further configured to store the determined identity  
of the unidentified field to the database.

18. The system of claim 17, wherein the form is an e-form readable in a Web browser.

19. The system of claim 18, wherein the data collector module is configured to access the  
source code of the e-form.

20. The system of claim 18, wherein the data collector module is configured to OCR a  
captured image of the e-form.
